CARBOCON is a leading and independent service provider when it comes to carbon reinforced concrete. Whether it's project management, planning and consulting for construction projects, transfer to industry or special issues relating to the development and approval of innovative and technical solutions, right through to patent applications.

Carbon concrete is a composite material made from two high-performance materials. The combination of carbon fibres in the form of fabrics or rods with fine concrete enables a significantly more diverse construction method with a high load-bearing capacity at the same time. Due to the corrosion resistance of the scrims and rods, the concrete cover and thus the use of resources can be minimised. With carbon concrete, construction can be sustainable, resource-saving, less material-intensive and lighter. Planning services and subsequent applications with carbon reinforced concrete often require special solutions and approaches. The knowledge of services and the existing and approved products of conventional technologies only allow the use of carbon reinforced concrete up to certain limits. Building with carbon concrete therefore requires a very specific variety of products. CARBOCON is available with its expertise to develop the best solution together with customers and partners.
